

Ingersoll Rand Oil Sampling Instructions

Oil samples need to be taken every 6 months or 2000 hours whichever comes first.

1. Locate the oil sample kit that has been provided inside of the electrical compartment of the air compressor cabinet.

2. Stop and unload the air compressor by pressing the stop button.

3. Switch the main disconnect breaker to off position.

4. Remove the oil filler cap and make note of the coolant (oil) type for later step.

5. Insert hose through the top of the pump until it protrudes approximately 1 inch. Tighten thumbscrew gently to secure hose.

6. Screw the oil sample container to the bottom of pump.

7. Insert hose into the sump of compressor halfway into the oil (make sure not to take the sample from bottom of the sump). Use pump and sample container to collect a sample at least 3/4 of the volume of the container. Secure cap. Top up oil in air compressor if necessary and replace oil filler cap. Turn on breaker and restart the air compressor.

8. Fill out the required paperwork completely including the sticker that needs to be adhered to the oil sample container. Ship the sample back to Ingersoll-Rand Edmonton. The oil sample will be sent to the lab and the results will be e-mailed to the contact and e-mail address provided on the supplied forms.

Please see the back of the page for oil sample kit re-ordering instructions.

These instructions are also on our website at www.tkcompressor.com or call us at 780-447-1578.
